Epic 44: Mobile Number Field Accepts Invalid Input & Allows Sending OTP Multiple Times							
US44_AC1	TC44.1	Verify mobile number field rejects input with fewer than 10 digits	Given a user is on the Meesho Login/Registration page When they enter a mobile number with fewer than 10 digits (e.g., '12345') And click 'Send OTP' Then the system should display a validation error And the OTP request should not be sent	Mobile Number: 12345	System displays a validation error (e.g., 'Enter a valid 10-digit mobile number') and does not trigger an OTP request	System accepts the number without any validation error and proceeds to send the OTP request	Failed
US44_AC2	TC44.2	Verify mobile number field rejects input with more than 10 digits	Given a user is on the Meesho Login/Registration page When they enter a mobile number with more than 10 digits (e.g., '1122336655123') And click 'Send OTP' Then the system should display a validation error And the OTP request should not be sent	Mobile Number: 1122336655123	System displays a validation error for exceeding the 10-digit length and does not trigger an OTP request	System accepts the number without any validation error and proceeds to send the OTP request	Failed
US44_AC3	TC44.3	Verify mobile number field rejects a random/non-existent but correctly formatted 10-digit number	Given a user is on the Meesho Login/Registration page When they enter a random 10-digit number that is not a valid/allocated mobile number (e.g., '1122336655') And click 'Send OTP' Then the system should still validate the numbering pattern (e.g., valid Indian mobile prefixes 6-9) And should flag or reject numbers that do not match a valid telecom numbering pattern	Mobile Number: 1122336655	System validates the numbering pattern and displays an error for numbers that do not match a valid mobile prefix/pattern	System accepts the random number without any validation error and sends the OTP request	Failed
US44_AC4	TC44.4	Verify mobile number field rejects non-numeric or special-character input	Given a user is on the Meesho Login/Registration page When they enter a mobile number containing alphabets or special characters (e.g., '98abc@123') And click 'Send OTP' Then the system should display a validation error And the OTP request should not be sent	Mobile Number: 98abc@123	System displays a validation error for invalid characters and blocks the OTP request	System accepts alphanumeric/special-character input without any validation error and proceeds to send the OTP request	Failed
US44_AC5	TC44.5	Verify 'Send OTP' button is disabled/blocked until a valid mobile number is entered	Given a user is on the Meesho Login/Registration page When the mobile number field is empty or contains an invalid value Then the 'Send OTP' / 'Get OTP' button should remain disabled or show an inline error on click And no OTP request should be dispatched to the backend	Mobile Number: (blank / invalid)	'Send OTP' button is disabled or blocks submission with an inline error until a valid 10-digit number is entered	'Send OTP' button remains active and clickable regardless of input validity, and the request is dispatched to the backend	Failed

US44_AC6	TC44.6	Verify a cooldown timer is enforced between consecutive OTP requests for the same number	Given an OTP has just been requested for a mobile number When the user clicks 'Resend OTP' / 'Send OTP' again immediately Then the system should enforce a cooldown period (e.g., 30-60 seconds) And should display a timer/message indicating when the next request is allowed	Mobile Number: 9876543210 Retry Interval: Immediate (0 sec)	System blocks the repeat request and shows a cooldown timer (30-60 seconds) before allowing another OTP request	System accepts the repeat request immediately with no cooldown timer, and a new OTP is sent	Failed
US44_AC7	TC44.7	Verify a maximum limit on OTP requests per mobile number within a defined time window	Given a user repeatedly clicks 'Resend OTP' / 'Send OTP' for the same mobile number When the number of requests exceeds the allowed maximum within a set time window (e.g., 5 requests per hour) Then the system should block further OTP requests And should display a message indicating the limit has been reached	Mobile Number: 9876543210 Requests Attempted: 10 within 5 minutes	System blocks further OTP requests after the maximum allowed count and displays a limit-reached message	System allows unlimited OTP requests with no maximum threshold enforced, and no limit-reached message is shown	Failed
US44_AC8	TC44.8	Verify OTP requests to invalid/random numbers do not result in repeated SMS dispatch (anti SMS-bombing check)	Given an invalid or random mobile number is entered When 'Send OTP' is clicked multiple times in quick succession Then the system should either reject the number outright (per AC1-AC3) Or, if accepted, should still apply rate-limiting/cooldown controls to prevent repeated SMS dispatch And should not allow the platform's messaging infrastructure to be used for SMS bombing	Mobile Number: 1122336655 Attempts: 10 rapid clicks	System either rejects the invalid number or applies rate-limiting so that repeated SMS dispatch to the number is prevented	System accepts the invalid/random mobile number and dispatches repeated OTP SMS with no validation, cooldown, or rate limit — creating an SMS bombing / abuse risk and wasted SMS gateway cost	Failed
US44_AC9	TC44.9	Verify OTP is sent successfully and the OTP-entry screen is shown for a genuinely valid, correctly formatted mobile number	Given a user is on the Meesho Login/Registration page When they enter a valid, correctly formatted 10-digit mobile number (starting with 6-9) And click 'Send OTP' Then an OTP should be sent to the number And the user should be navigated to the OTP-entry screen	Mobile Number: 9123456780 (valid format)	OTP is sent successfully and the user is navigated to the OTP-entry screen	OTP is sent successfully and the user is navigated to the OTP-entry screen as expected	Passed
US44_AC10	TC44.10	Verify the mobile number input field restricts entry to numeric keys only via the on-screen/mobile keypad	Given a user taps into the mobile number field on a mobile device When the on-screen keyboard appears Then it should default to a numeric keypad And the field should not allow direct entry of letters via the numeric keypad	Device: Mobile browser / App	Numeric keypad is shown by default and letters cannot be entered directly through it	Numeric keypad is shown by default and letters cannot be entered directly through it, as expected	Passed
